11. Disposal/recovery operation (2)

D-code/R-code (5):

R4 – R4 Recycling/reclamation of metals and metals compounds

Technology employed (6):

Batteries are drained and processed in a dedicated lead recycling facility. The lead-bearing fractions are smelted in a lead shaft furnace and refined into secondary lead and lead alloys. Sulphuric acid is collected separately and treated in the facility's water treatment system. Treatment residues containing recoverable lead are recycled back into the process.

Reason for export (1)(6):

High material recovery rate and represents one of the best available recycling solutions for this waste stream. Limited capacity in Norway, and export to Boliden ensures efficient recovery, while supporting the circular use of secondary raw materials.

12. Designation and composition of the waste (6):

Spent lead-acid batteries originating from vehicles, industrial equipment and backup power systems. The waste consists primarily of metallic lead, lead compounds, plastic casings and sulphuric acid electrolyte.

13. Physical characteristics (5):

☑ 2 – Solid

☑ 5 – Liquid

Whole spent lead-acid batteries containing both solid and liquid fractions. The solid fraction consists of lead plates, lead compounds and plastic casings. The liquid fraction consists of sulphuric acid electrolyte contained within the batteries.
